

# Epicardial pacing – Can we avoid thoracotomy/sternotomy?

*J. Janoušek*

Children's Heart Center  
University Hospital Motol  
Prague, Czech Republic

# Epicardial pacing survival according to implantation era

Initial epicardial pacing allows to defer transvenous implantation to a significantly higher age

**Permanent Cardiac Pacing in Children - Choosing the Optimal Pacing Site: A Multi-Center Study**

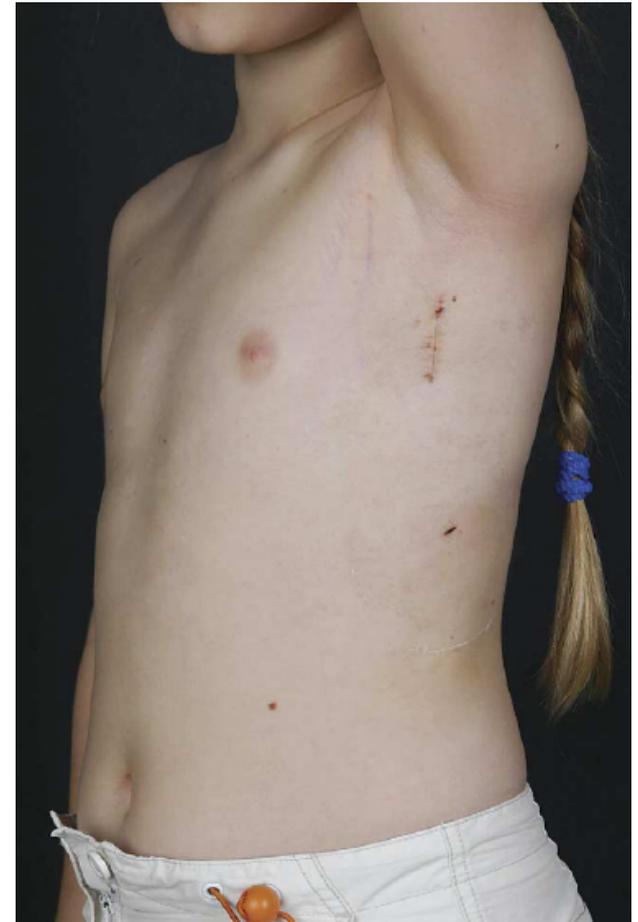

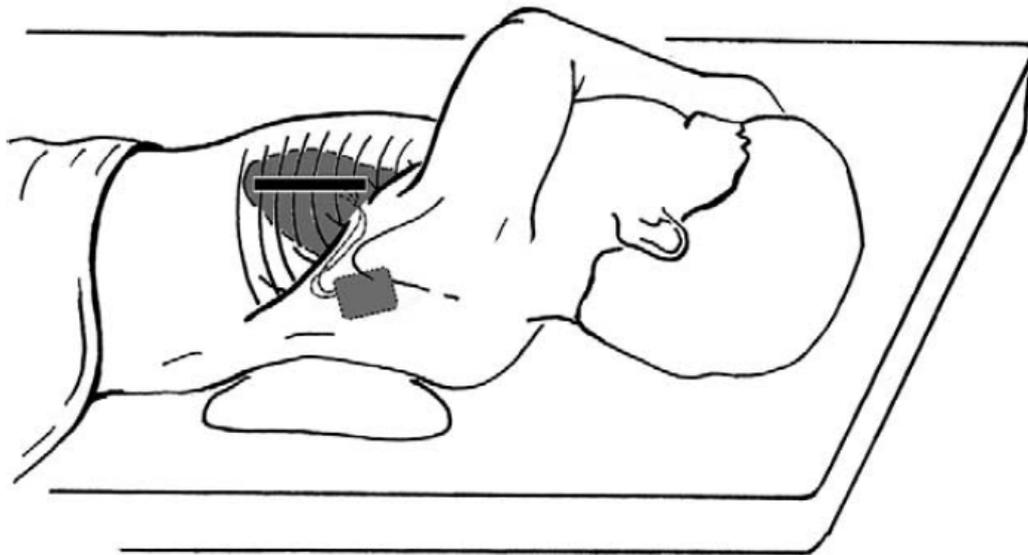

Factors associated with preservation of LV function (LV EF ≥55 %)

Variable in model	LV EF ≥55 %	LV EF <55 %	p-value	Odds ratio (95% CI)
Male gender	36.1 %	54.1 %	0.086	0.45 (0.18-1.12)
Congenital AV block	73.6 %	80.5 %	0.972	0.98 (0.29-3.35)
Maternal autoantibodies	41.1 %	49.3 %	0.103	0.37 (0.11-1.23)
Age at implantation [years]	4.24 (4.46)	4.69 (4.83)	0.323	0.94 (0.82-1.07)
<b>LVA and LVLat pacing</b>	<b>29.2 %</b>	<b>4.7 %</b>	<b>0.018</b>	<b>8.26 (1.46-47.62)</b>
DDD pacing	45.8 %	50.6 %	0.455	1.50 (0.52-4.33)
Pacing duration [years]	5.88 (3.78)	6.64 (4.30)	0.425	0.95 (0.84-1.08)
QRS duration [ms]	149 (22)	158 (23)	0.593	0.99 (0.97-1.02)

**Left heart atrial and ventricular epicardial pacing through a left lateral thoracotomy in children: a safe approach with excellent functional and cosmetic results**

Ali Dodge-Khatami, Alexander Kadner, Hitendu Dave, Mariette Rahn, René Prêtre and Urs Bauersfeld

# Minimal invasive ASD surgery

# What do we have right now?

---

- Current thoracoscopic techniques
  - Invented mainly
    - For epicardial left ventricular CRT leads
    - For epicardial ICD leads in children
  - Clinical experience – adults
  - Animal studies mimicking pediatric implantation

# Human studies

# Left ventricular apical pacing in children – feasibility and long-term effect on ventricular function

*Kovanda J., Janousek J., Lozek M., Kubus P.*

*Accepted for AEPC 2017*

- N=36 patients with CAVB
  - spontaneous (N=22)
  - surgical (N=14)
  - 18/22 spontaneous CAVB – subxiphoid approach
    - Weight median 10.4 (2.7 -34.0) kg

# Video-Assisted Thoracoscopic Left Ventricular Pacing in Patients With and Without Previous Sternotomy

Ann Thorac Surg 2013

Katharine E. Nelson, MBBS, MRCP, Matthew G.D. Bates, MBChB, MRCP, Andrew J. Turley, MBChB, MRCP, Nicholas J. Linker, MD, FRCP, and W Andrew Owens, MD, FRCS (CTh)

Three ports were used.

The first was positioned in the midaxillary line, typically in the third or fourth intercostal space, for insertion of the thoracoscope, a second port was placed inferior to this, and a third port was placed anteriorly

A screw-in Myopore epicardial lead (Enpath Medical Inc, Minneapolis, MN), was placed into an unscarred area of myocardium as far posterior to the obtuse marginal arteries as possible. In the latter part of the series, the FasTac Flex device (Enpath Medical Inc) was available, and this facilitated more precise lead placement in patients with particularly dilated or displaced LVs.

JOSEF KAUTZNER, M.D., PH.D.†

JACC 2014

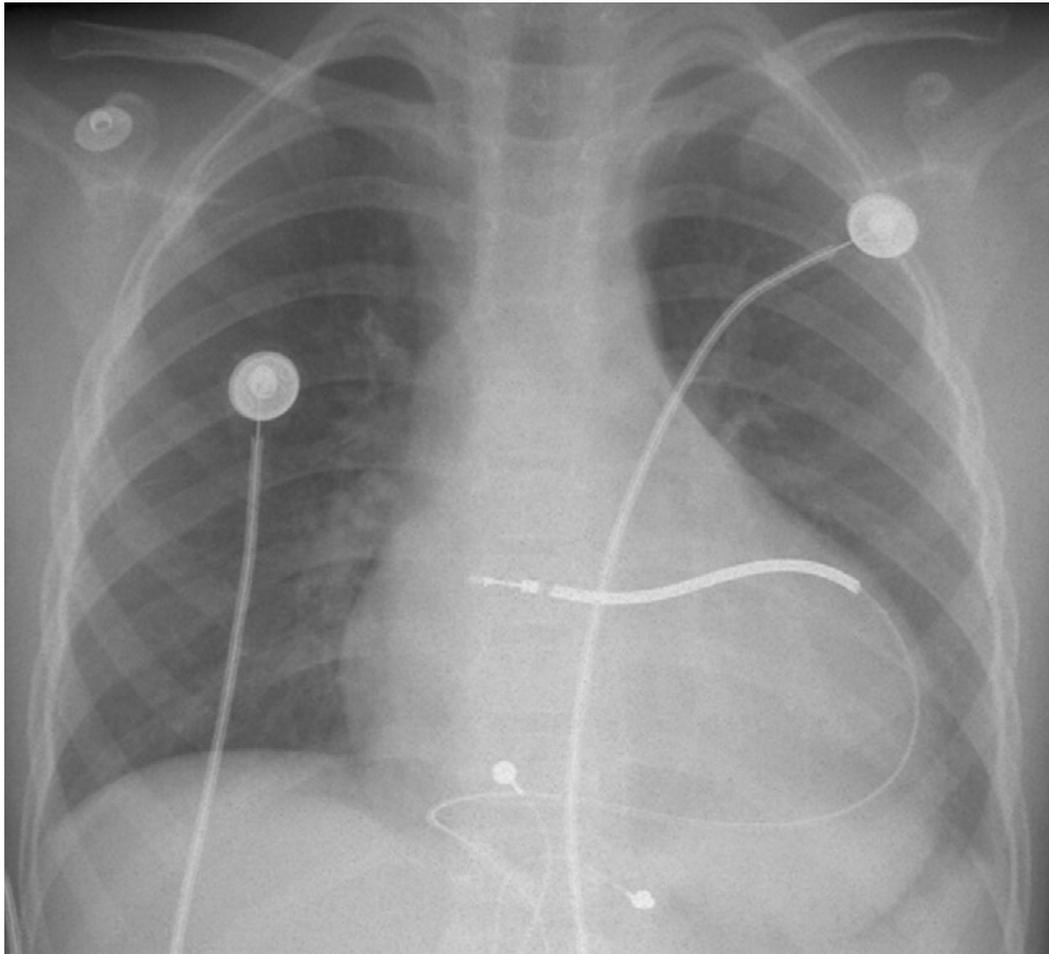

A standard, 3-port thoracoscopic approach was used for LV free wall mapping, and subsequent LV lead implantation.

A bipolar, sutureless epicardial pacing lead (Myopore<sup>®</sup>, Greatbatch Medical, NY, USA) was implanted at the site with maximum QLV.

5 piglets, weight 4-5 kg

The pericardial space was then accessed through a subxiphoid approach under direct thoracoscopic visualization by inserting a micropuncture pericardiocentesis needle (7 cm) into the pericardial space.

a guidewire was delivered followed by a microdilator, and an S4 sheath (40 cm, 8F) with dilator was then introduced over the wire. Landmark structures were visualized with the thoracoscope.

Medtronic 3830 SelectSecure is a thin bipolar, steroid-eluting, polyurethane-coated, lumenless screw-in active-fixation pacing lead typically utilized (and labeled) for transvenous pacing. The pacing lead was fixed to the LV epicardium and alternatively to the left atrial appendage

# Where may be the (bright?) future?

Optical termination of  
a ventricular arrhythmia in an  
optogenetically modified adult rat heart

Nyns et al.  
Heart Lung Center Leiden, the Netherlands

Systemic delivery of cardiotropic adeno-associated virus vectors, encoding the light-gated depolarizing ion channel red-activatable channelrhodopsin (ReaChR), resulted in global cardiomyocyte-restricted transgene expression in adult Wistar rat hearts allowing ReaChR-mediated depolarization and pacing.
